Bonnell Newnan to change packaging strapping from steel to plastic

The Newnan facility of Bonnell Aluminum is in the process of changing its strapping material used to attach the wooden blocks on the bundles from steel to plastic. This change, which will reduce waste disposal, is expected to be transparent to the customers as extensive testing and multiple shipments have already been conducted with positive results.

As a safety precaution, Bonnell wants to remind its customers that the straps used to hold the wooden blocks (whether plastic or steel) are not intended for lifting, as rupture of the straps may occur and lead to serious injuries.
